IBM® QRadar® SIEM consolidates log events and network flow data from thousands of devices, end-to-end throughout a network. It normalizes and correlates raw data to identify security offenses, and uses an established baseline normal behavior, detect anomalies, uncover advanced threats, and remove false positives. As part of IBM X-Force® Threat Intelligence which supplies a list of potentially malicious IP addresses including IP addresses and other threats. IBM QRadar SIEM can also correlate system vulnerabilities with event and network data to identify security incidents.

IBM QRadar SIEM:

- **Provides real-time visibility** to the entire IT infrastructure for threat detection and prioritization.
- **Reduces and prioritizes alerts** to focus security analyst investigations on an actionable list of suspicious events.
- **Enables more effective threat management** while producing detailed data access and user activity reports.
- **Operates across on-premises and cloud environments.**
- **Produces detailed data access and user activity reports** to help manage compliance.
- **Offers multi-tenancy and a master console** to help managed service providers provide security in an effective manner.

+ More

Leverages the threat intelligence expertise of the [IBM X-Force research](#) and development team to provide security, and permits access to the [IBM Security App Exchange](#) for threat collaboration and management.
